

Echoes AI 2.0

Visual Master Guide & Step-by-Step Walkthrough

Transform live voice and uploaded meeting conversations into structured intelligence, speaker-attributed transcripts, automated Kanban tasks, and meeting health scores.

Capture & Diarize

Real-time browser mic recording or high-speed upload with AssemblyAI multi-speaker voice attribution.

Gemini AI Intelligence

Automated synthesis of executive summaries, key decisions, prioritized action items, and health ratings.

Enterprise Scopes

Multi-tenant organization RLS with default "Assigned Items Only" member protections and address-bar guards.

USER GUIDE CONTENTS

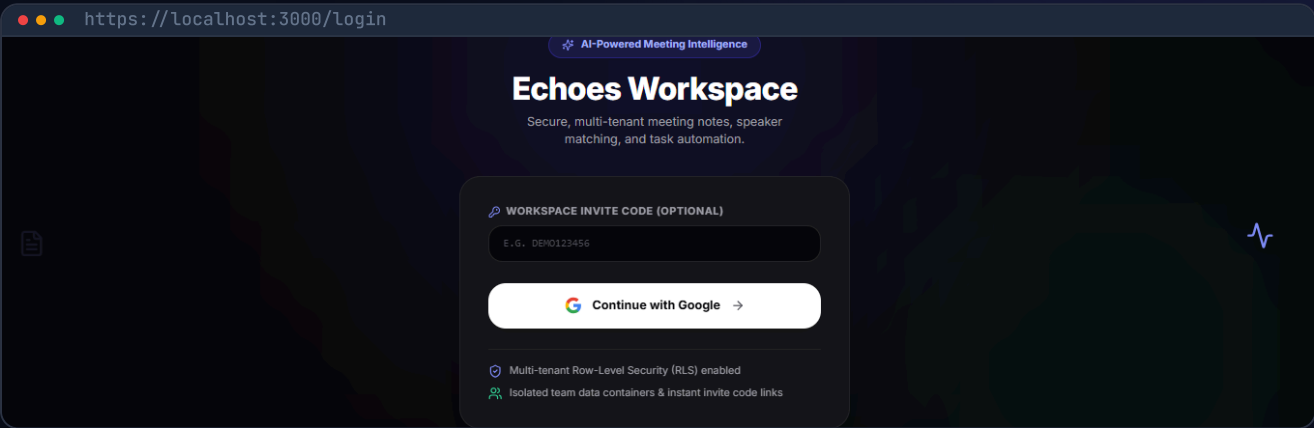

6 High-Impact Sections

- | | |
|---|-------------------------------------|
| 1 Sign-In & Multi-Tenant Workspaces | 4 Kanban Task Board & 1-Click Sync |
| 2 Live Audio Recording & File Upload | 5 Restricted Member Portal & RLS |
| 3 AI Diarization & Meeting Health Score | 6 Revoke Access, Exports & Security |

STEP 1 OF 5

1 Authentication & Multi-Tenant Setup

Securely access your workspace using Google OAuth or join an existing team organization via an encrypted invite code.

Google OAuth Sign-In Instant

Click "Sign In with Google" to authenticate via Supabase Auth. Your personal workspace is initialized automatically with Row Level Security (RLS).

Join via 6-Digit Code Collaborate

Invited by a teammate? Enter the 6-character Workspace Code in the login card to immediately bind your account to their organization.

Switching & Creating Workspaces

Click the **Workspace Switcher** in the top navigation bar. Owners can create new organization workspaces, copy 6-digit invite codes, or invite members by per-person link.

Role-Based Safety Protections

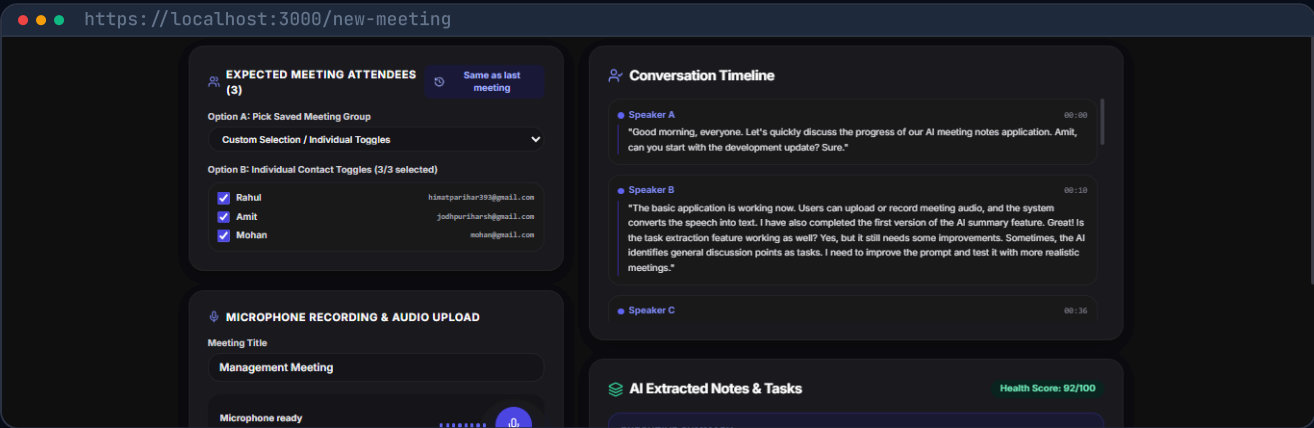

Invited teammates are locked from accidentally deleting workspaces or leaving without admin consent, maintaining uninterrupted enterprise compliance.

Pro-Tip for Workspace Owners: You can create multiple independent client workspaces (e.g. *GLS Nexus*, *Acme Corp*) under one login and seamlessly switch between them without logging out.

STEP 2 OF 5

2 Live Audio Recording & File Ingestion

Capture conversations live in real-time or upload pre-recorded meetings across multiple languages.

-  **1. Live In-Browser**
Click "Start Live Recording". Echoes utilizes real-time audio chunking, volume meter visualization, and pauses.
-  **2. Audio File Drop**
Upload .mp3, .wav, .m4a, or .webm. Automatically compressed in-browser before upload to conserve bandwidth.
-  **3. Multi-Lingual**
Select English, Hindi, or Gujarati. Transcribes native phrasing and translates action items automatically.

 **Audio Pipeline Architecture**
When recording stops, Echoes uploads the encrypted audio directly to your dedicated Supabase Storage bucket, triggering the AssemblyAI diarization webhook and Gemini extraction pipeline.

 **Audio Safety Shield:** If your network disconnects during a live recording, Echoes stores local cached audio chunks in browser IndexedDB to prevent meeting audio loss.

STEP 3 OF 5

3 AI Diarization & Meeting Health Score

Automated speaker identification, structured executive summaries, and quantitative conversation health metrics.

Dynamic Health Score (0–100)

Proprietary

Measures meeting effectiveness based on four key pillars: **Engagement** (speaker balance), **Clarity** (conciseness), **Actionability** (concrete tasks identified), and **Tone**.

Speaker Diarization

AssemblyAI

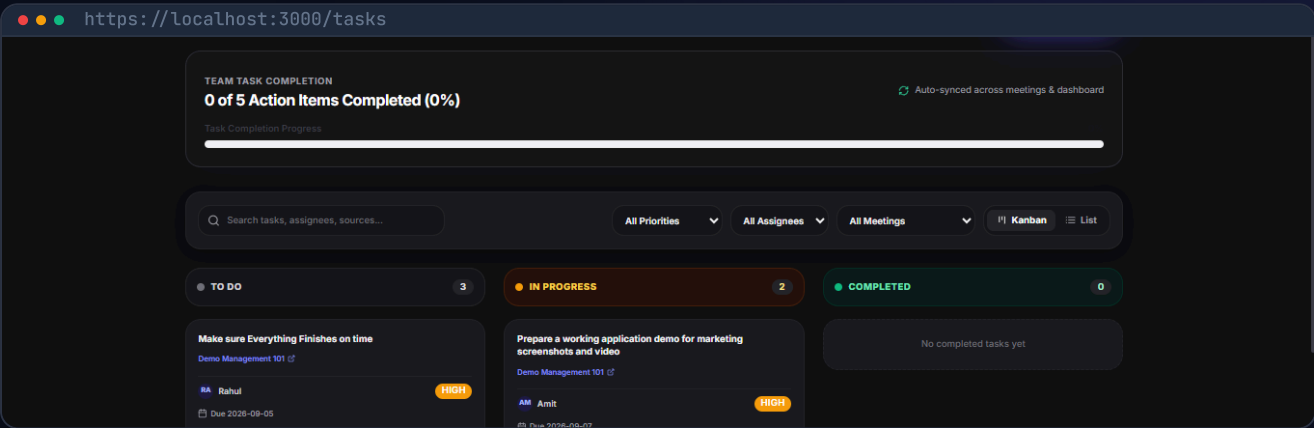

Every spoken sentence is attributed to individual speakers (e.g. *Speaker A*, *Speaker B*) with accurate millisecond timestamps and sentiment tagging.

Extracted Artifact	AI Engine	Output Format	Primary Use-Case
Executive Summary	Google Gemini 1.5/2.0	Structured Markdown	Quick 60-second stakeholder recap
Action Items	Gemini Structured Output	Array with Assignees & Priority	Direct ingestion into Kanban Board
Key Decisions	Gemini Reasoning	Bullet consensus points	Eliminates post-meeting ambiguity
Full Transcript	AssemblyAI Diarization	Timestamped Speaker Dialogue	Compliance, audit, and keyword search

STEP 4 OF 5

4 Kanban Task Board & Integrations

Convert conversation promises into completed deliverables with real-time velocity tracking and 1-click sync.

Drag & Drop Kanban Lifecycle

Organize extracted items into **To Do**, **In Progress**, **Review**, and **Completed**. Tasks update in Supabase with instant optimistic UI feedback.

1-Click Google Calendar Sync

Click "**Add to Calendar**" to schedule follow-up deliverables directly on Google Calendar with meeting deep-links included.

Automated Email Task Digests

Dispatch formatted meeting digests and personalized action lists to all attendees via Nodemailer (Gmail SMTP & Resend).

One-Click PDF & DOCX Export

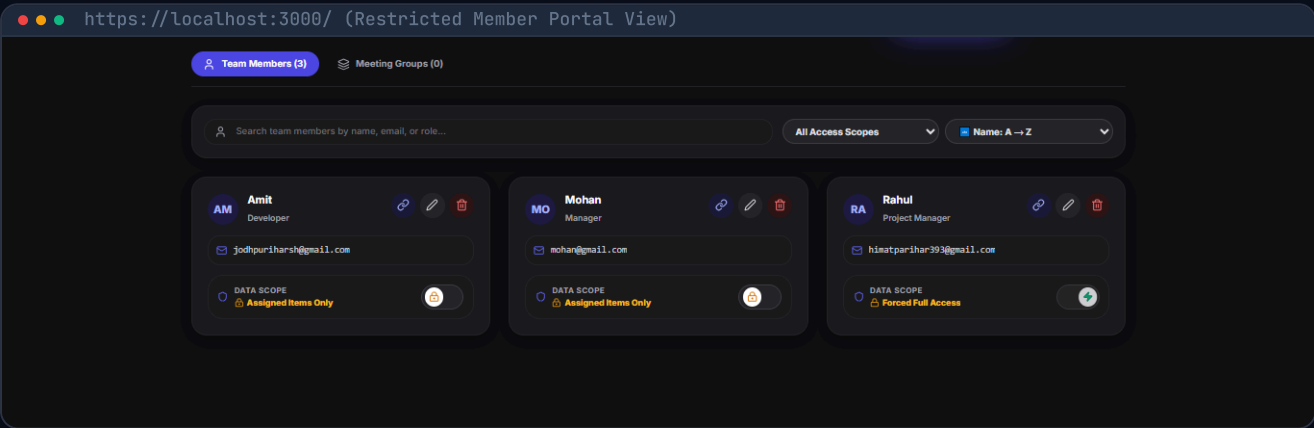

Generate pixel-perfect executive PDF summaries or editable Microsoft Word (.docx) reports ready for distribution.

Meeting Velocity Metric: The Task Board aggregates velocity scores across all team members, tracking how fast tasks move from "To Do" to "Completed" each sprint.

STEP 5 OF 5

5 Restricted Member Portal & Governance

Enterprise data isolation, default "Assigned Items Only" scoping, and address-bar route protection.

Default "Assigned Items Only" Strict Default

Every newly invited team member automatically defaults to restricted data scope. They can **only** see tasks and meetings explicitly assigned to them.

Address Bar URL Guard Guarded

If a restricted teammate attempts to manually type /meetings or /team in their browser, they are instantly redirected to their clean Member Portal.

Workspace Owner Administrative Controls

Fluid Scope Switch: Toggle any member between "Full Workspace Access" and "Assigned Items Only" in 1 click on the /team page.

Revoke Access Safe Retention: Revoking access instantly removes workspace login tokens while preserving historical task assignments in your directory.

You are all set! Start by creating a workspace, invite your team, record your next team standup, and let Echoes AI automate your meeting intelligence from start to finish.
